Job Market Paper

Try Before You Choose: Early Work Experience and Occupational Choice [Latest version]

Occupations shape individuals' economic and non-economic outcomes, yet young people often choose a field with little knowledge of the work. Can a short work experience, assigned at the moment they choose a career, change what they do for a living? Using a difference-in-discontinuities design, I exploit that the suspension of German conscription in 2011 split one cohort of high-track graduates at the school-entry cutoff: men born before the cutoff could still be drafted into the military or the social alternative service, men born after could not.

The draft shifts young men towards the occupations of the service, and persists through their late twenties. The shift is selective, moving individuals towards the service-related occupations with better working conditions and more qualified positions, and comes at no detectable cost to education, labor market entry and earnings. Surveys of former participants point to information as a channel. An early work experience, assigned at a formative moment, can thus shape occupational choice, even for those who would not have chosen it.
